WORKPULSE

Monetization Strategy

MVL employee-focused proposal • Version 1 • October 2026

1. Overview, Target Users, and Value

WorkPulse is a web-based employee attendance and work analytics information system for MVL. The researcher's interview clarification identifies manual payroll preparation and possible time-in records for employees who are not physically present as the main concerns. The system combines attendance, employee records, leave, cash advances, payroll summaries, notifications, and reporting.

Item	WorkPulse approach
Target users	MVL employees: Regular, Extra, and Manager / Supervisor classifications
Administrative stakeholders	MVL owners and authorized administrators
Potential paying party	MVL management; employees have no individual access fee
Business model	One-time system implementation payment, with maintenance paid separately when requested
Current deployment	Free-tier Vercel frontend and Render backend, as reported by the developer

The workplace is in Salay Riles, Mangaldan, Pangasinan. Chapter 2 identifies 30 study participants: two owners, two managers/supervisors, ten regular employees, and sixteen extra employees. This is a study population, not a count of interviews or paying customers.

Value Proposition

MVL problem	WorkPulse response	Expected benefit
Manual payroll preparation	Prepare payroll using recorded attendance, configured rates, deductions, and carried earnings; show payslip summaries	Reduce repeated calculation and support review of employee earnings
Possible "ghost attendance": recorded time-in without physical presence	Fingerprint time-in/time-out at the local workstation; attendance source indicators and correction history	Support identity checks and review of proxy-attendance concerns
Attendance and work-hour discrepancies	Recorded sessions, date-range views, and validated administrator corrections	Help reconcile records before payroll settlement
Limited employee visibility	Personal attendance and payroll portal, request status, and notifications	Help employees understand records affecting their pay

These needs are qualitative findings from Chapters 1–3 and the interview clarification. "Ghost attendance" describes a concern, not proven fraud. A fingerprint scan verifies an attendance event, not continuous presence throughout a shift. Payroll accuracy depends on correct inputs and authorized review; benefits must be measured.

2. Pricing, Payment, and Maintenance

The team proposes a ₱20,000–₱50,000 one-time implementation package for MVL, depending on the agreement with MVL and the setup and delivery scope. This is the team's proposed valuation, not an agreed purchase or verified market price. Employee portal access is included; there is no monthly software subscription.

Charge	Proposed price	Scope
System implementation	₱20,000–₱50,000 once	Agreed existing features, configuration, deployment, record setup, installation, testing, training, and handover
Routine maintenance	₱500–₱2,000 per job	Depends on the issue, effort, and complexity; examples include minor fixes, troubleshooting, and routine updates
Major maintenance	Separate quote	Complex recovery, migration, extensive repairs, or work beyond routine maintenance; may exceed ₱2,000
New features	Separate quote	Additional modules or substantial feature changes; priced by scope and effort
Fingerprint equipment	Separate quote if needed	Reader, workstation, and hardware not included in the system price
Current hosting	₱0 assumed provider charge	Reported free-tier Vercel and Render deployment; future paid infrastructure budgeted separately

Payment Options

MVL may pay in full or through agreed milestones. Example only: a ₱25,000 package could be paid as ₱10,000 upon agreement, ₱10,000 after deployment and user testing, and ₱5,000 at final acceptance. Installments change timing, not the total price; the final schedule requires MVL's agreement.

Maintenance Process

MVL reports an issue or requests a change. The team provides a job-specific quote, obtains MVL's agreement, completes and verifies the work, and invoices as agreed. Routine jobs are proposed at ₱500–₱2,000; major work and new features require separate quotes. No automatic monthly charge or annual renewal is proposed.

Service term	Proposed agreement
Included corrections	Specify an agreed post-delivery correction period and covered defects; do not charge separately for work already included
Acceptance and handover	Define acceptance checks, documentation, accounts, usage rights, and any source-code transfer
Operational responsibilities	Assign deployment, backups, monitoring, and record-export responsibilities; continuous support requires a separate arrangement
Future hosting upgrades	Confirm provider suitability and actual charges, agree the budget, and identify who pays before upgrading

Free hosting does not make maintenance labor free. Wages, cash advances, repayments, and carried payroll balances remain employer/employee funds and are not WorkPulse revenue. WorkPulse records settlement and disbursement confirmation; it does not itself transfer funds through a bank or payment gateway.

3. Cost Computation, Income, and Break-even

The proposed system valuation is ₱20,000–₱50,000. Check actual effort and expenses before choosing a final amount. The routine maintenance range is ₱500–₱2,000 per requested job; major work and new features are priced separately. Charges to the client must not be added again as expenses.

Cost item	Planning computation
Implementation labor	Estimated hours × agreed internal hourly cost, including configuration, installation, testing, training, and handover
Maintenance labor	Hours for the requested job × internal hourly cost
Travel, materials, and equipment	Actual job-related expenses not already counted in labor or supplied by MVL
Vercel and Render hosting	Current reported free-tier subscription expense: ₱0; paid upgrades costed separately if needed
Other infrastructure	Confirm database, backups, connectivity, and hardware costs; free frontend/backend hosting does not establish that all infrastructure is free

Revenue Planning for One MVL Deployment

Scenario	Illustrative gross income
System package only	₱20,000–₱50,000 once, depending on agreed price
Example: ₱25,000 package + two ₱1,000 routine jobs	₱27,000 total; job count and amounts are assumptions
Following years	Only commissioned maintenance and new-feature income; no repeat system fee
No requested paid work	₱0 maintenance income for that period

Total service income = implementation fee + maintenance job fees + additional-feature fees. Record the implementation payment once. Track invoices and collections separately. Future maintenance orders and renewals are not guaranteed.

Break-even Logic

Implementation cost = labor + direct delivery expenses + any allocated overhead. The implementation fee covers delivery costs when it is at least this total. For maintenance, the job fee must cover that job’s labor, direct expenses, and any allocated overhead. Count every cost once.

Estimated remaining balance = service income − all counted costs. For a ₱25,000 package, cost coverage occurs when all counted implementation costs are at most ₱25,000. A ₱1,000 maintenance job covers its costs only if those costs are at most ₱1,000. Actual profit requires actual expenses, taxes, and collections; no costs or profit are invented here.

Benefits to MVL and the Development Team

MVL employees gain visibility into their attendance and pay records; administrators gain a more consistent payroll and correction workflow. The development team may earn implementation and requested-maintenance income and gain deployment experience. Time savings, fewer discrepancies, and financial returns depend on actual use, review results, costs, and payment collection.

4. Pilot Plan, Success Measures, and Risks

Run a proposed 30-day MVL pilot to check payroll preparation, attendance traceability, and employee record access. Keep independently reviewed source records for comparison. This is a validation plan, not an achieved result.

Stage	Timing	Activities
Baseline and setup	Days 1–7	Record manual payroll preparation time; confirm rates, accounts, and attendance procedures; test the local scanner and train users
Guided operation	Days 8–21	Exercise attendance and employee portal workflows; compare a payroll cycle or controlled payroll examples with independently checked records
Review and acceptance	Days 22–30	Review discrepancies, time spent, user feedback, access controls, and recovery; agree delivery acceptance and any further work

Proposed Success Measures

Measure	Target or review method
Payroll preparation time	Aim for 20% less time than a comparable manual baseline; measure rather than assume savings
Payroll reconciliation	Review all pilot payroll statements against approved attendance, rates, and deductions
Attendance traceability	Check source indicators and required reasons/history for manual entries and corrections
Employee access	Confirm participating employees can view their own attendance and payroll summaries and raise discrepancies
Presence concerns	Log reported concerns and verified outcomes separately; do not assume a zero-fraud result

Key Risks and Mitigation

Risk	Mitigation
Incorrect pay or false-presence records	Validate inputs; require payroll review; inspect attendance sources and correction history
Scanner, network, or hosting interruption	Test local components and recovery; use approved, documented manual contingencies
Sensitive employee data exposure or loss	Validate ownership controls, restricted administration, logs, backups, and restoration
Unclear maintenance or funding	Define included corrections and ongoing responsibilities; agree job quotes before paid work
